

In the Claims

Claims 1-21 and 26 were previously cancelled.

Claims 22-25 and 27-30 are currently amended.

Claims 22-25 and 27-31 remain in the application and are listed below.

1-21. (Canceled).

22. (Currently Amended) A system for securing data communication between an internet computer network and an external computer network, comprising:

a client located in the internal computer network;

a server located in the external computer network and in communication with the client; and

a proxy network address translation an application-level gateway proxy
device comprising:

components for (1) performing, at a packet level, a network address translation upon a stream of packets originating from the client and (2) filtering, at a stream level, the stream of packets and transmitting the packets to the server, wherein the filtering is transparent to the client, and wherein the network address translation component redirects the stream of packets to the filtering component; and

a communications socket internal to the proxy network address translation application level gateway proxy device and communicatively connected to the components for (1) performing the network address translation and (2) filtering.

1
2 23. (Currently Amended) The system of claim 22, wherein the components
3 of the proxy network address translation device comprise:

4 a first component for filtering said stream of packets, and also for filtering,
5 at a stream level and transparent to the client, a second stream of packets
6 originating from the server; and

7 a second component for performing said network address translation, and
8 also for performing, at a packet level, a reverse network address translation with
9 respect to the packets in the second stream and transmitting the packets in the
10 second stream to the client.

11
12 24. (Currently Amended) An application-level gateway proxy A device[[],]
13 comprising:

14 a proxy network address translation device comprising:

15 a component for performing, at a packet level, a network address
16 translation with respect to a stream of packets originating from a client in
17 an internal network, wherein the client is communicating the stream of
18 packets to a server located in an external network, and wherein the network
19 address translation component redirects the stream of packets to a
20 component for filtering;

21 the component for filtering, at a stream level, the stream of packets,
22 wherein the filtering is transparent to the client;

23 a communication socket internal to the proxy network address
24 translation application-level gateway proxy device and communicatively
25 connected to:

1 the component for performing the network address
2 translation; and

3 the component for filtering; and

4 a component for transmitting the packets to the server after the
5 packets are filtered.

6
7 25. (Currently Amended) The proxy network address translation device of
8 claim 24, further comprising:

9 a component for filtering, at a stream level and transparently to the client, a
10 second stream of packets originating from the server;

11 a component for performing, at a packet level, a reverse network address
12 translation upon the packet in the second stream; and

13 a component for transmitting the packet in the second stream to the client.

14
15 26. (Canceled).

16
17 27. (Currently Amended) The [[method]] proxy network address
18 translation device of claim 24, wherein filtering the stream of packets comprises
19 transforming the stream.

20
21 28. (Currently Amended) The [[method]] proxy network address
22 translation device of claim 24, wherein filtering the stream of packets comprises
23 compressing the stream.

1 29. (Currently Amended) The [[method]] proxy network address
2 translation device of claim 24, wherein filtering comprises content monitoring,
3 content restriction, stream transformation, traffic redirection and combinations
4 thereof.

5
6 30. (Currently Amended) A computer-implemented method for
7 communication between a first network and a second network comprising:

8 intercepting, at a first external socket of a proxy network address translation
9 device, a stream of packets;

10 performing, at a first internal component of the proxy network address
11 translation device, a network address translation upon the stream of packets, the
12 network address translation occurring at a packet level;

13 transmitting, from the first internal component of the proxy network
14 address translation device to a second internal component of the proxy network
15 address translation device using a communication socket internal to the proxy
16 network address translation device, the translated stream of packets;

17 filtering, at the second internal component of the proxy network address
18 translation device, the translated stream of packets, the filtering occurring at a
19 stream level; and

20 transmitting, from the second external socket of the proxy network address
21 translation device, the translated and filtered stream of packets.

22
23 31. (Previously Presented) The method of claim 30, wherein transmitting
24 from the first internal component of the proxy network address translation device
25 to the second internal component of the proxy network address translation device

1 comprises transmitting the translated stream of packets through an internal socket
2 of the proxy network address translation service.
